TABLE OF CONTENTS

MUSICAL TIME MACHINE

- Musical Time Machine is a Flask-based web application integrated with Spotify API.
- Allows users to log in with their Spotify account using OAuth 2.0.
- Generates personalized playlists based on:
  - Time Travel (Billboard Hot 100 by year)
  - Mood (Happy, Sad, Chill, Party)
  - Language (English, Hindi, Tamil, Malayalam, etc.)
  - Genre (Pop, Rock, Jazz, EDM, etc.)
  - Recently Played history

MUSICAL TIME MACHINE

- Uses Spotipy (Python client for Spotify Web API) for playlist creation.
- Scrapes Billboard Hot 100 for historical top English songs.
- Adds support for regional languages using Spotify's search and market-based queries.
- Provides a simple and interactive web dashboard (HTML + CSS + Flask templates).
- API integration
- Web development with Flask
- Data scraping
- Multi-user authentication

OBJECTIVES

- To develop a web-based playlist generator using Flask and Spotify API.
- To implement secure user authentication with Spotify OAuth (multi-user support).
- To provide multiple ways for users to create playlists:
  - Based on Billboard charts (time travel feature).
  - By mood, language, and genre preferences.
  - From recently played songs.
- To integrate web scraping (Billboard Hot 100) for historical data.
- To practice and demonstrate concepts of API integration, data handling, and web development.
- To create a user-friendly dashboard for playlist generation.

EXISTING SYSTEM

- Users rely on Spotify app or website for listening to music and creating playlists.
- Spotify provides curated playlists (e.g., Daily Mix, Release Radar, Mood/Genre playlists).
- Recently Played section is available but not automatically converted into playlists.
- No option to time travel to past music charts (e.g., Billboard Hot 100 by date).
- Limited support for multi-language playlist creation in one place.
- Users need to manually search and add songs to playlists.

PROPOSED SYSTEM

- A Flask-based web application integrated with Spotify API.
- Provides multi-user login using Spotify OAuth 2.0.
- Allows users to generate playlists automatically based on:
  - Billboard Hot 100 (Time Travel)
  - Mood preferences
  - Language choices
  - Music genres
  - Recently played songs
- Uses web scraping (Billboard) and Spotify search for fetching songs.
- Eliminates the need for manual playlist creation.
- Offers a simple, user-friendly dashboard for easy playlist generation.

MOTIVATIONS

- Music is an essential part of daily life and people often look for personalized playlists
- Manually creating playlists is time-consuming and repetitive
- Existing platforms like Spotify lack a direct feature to explore past charts such as Billboard Hot 100
- Regional and language-based playlist creation is limited in the current system
- Need for a simple web-based tool that automatically generates playlists based on user preferences
- Opportunity to learn and apply concepts of Flask, API integration, and web scraping in a real-world scenario

FUNCTIONALITIES

- User Authentication
  Secure login using Spotify OAuth 2.0 for multiple users
- Time Travel Playlist
  Generates playlists from Billboard Hot 100 based on a selected date (year, month, day)
- Mood-based Playlist
  Creates playlists depending on the user's mood such as happy, sad, chill, or party
- Language-based Playlist
  Allows users to create playlists in preferred languages like English, Hindi, Tamil, Malayalam

FUNCTIONALITIES

•Genre-based Playlist

Generates playlists by selecting genres such as Pop, Rock, Jazz, Classical, EDM, Hip-Hop

•Recently Played Playlist

Converts a users recently played tracks into a new playlist

•Dashboard Interface

User-friendly web dashboard for selecting features and generating playlists

•Logout Feature

Secure logout option with session clearing and Spotify account sign-out

MODULE DESCRIPTION

•User Authentication Module
Handles Spotify login using OAuth 2.0 and manages user sessions
•Dashboard Module
Provides a central interface where users can choose playlist generation options
•Time Travel Module
Scrapes Billboard Hot 100 for a given date and creates a playlist with top songs from that period
•Mood-based Module
Generates playlists by mapping moods (happy, sad, chill, party) to suitable tracks

MODULE DESCRIPTION

•Language-based Module

Creates playlists based on the user's selected language by searching Spotify content

•Genre-based Module

Allows users to pick a genre (Pop, Rock, Jazz, Classical, EDM, Hip-Hop) and generates playlists

•Recently Played Module

Fetches the users recently played songs and compiles them into a playlist

•Logout Module

Clears user session data and provides an option to log out from both the app and Spotify

DEVELOPING ENVIRONMENT

- Operating System: Windows 10 / Linux (development and testing)
- Programming Language: Python 3.x
- Framework: Flask (web framework)
- Front End: HTML, CSS, Jinja2 templates
- Back End: Flask with Spotipy (Spotify API integration)
- Database: Not required (session-based storage only)
- Web Scraping: BeautifulSoup (for Billboard charts)
- APIs: Spotify Web API (via Spotipy)
- IDE / Editor: Visual Studio Code
- Package Manager: pip (Python package installer)
- Version Control: Git and GitHub
